847 two to three years, as women nurse their children until they
834 are at least two years old. Faced with this prospect, young
853 couples may decide to kill their child, irrespective of its sex.[1]

847 Infanticide is effected by a number of techniques. Most commonly, a woman strangles her child with a vine as soon as it is delivered. In other cases the child is allowed to suffocate if it does not begin breathing spontaneously. If the child begins to breathe, the mother may simply abandon it where it is born, or throw it into the jungle. A case of attempted infanticide came to my attention by way of the New Tribes Mission. A woman in one of the villages on the Padamo
[799] River threw a new-born daughter into the jungle. The missionary living with the woman's village found the baby and took it into his own home. The woman had either struck the child on the head with an instrument, or the child had hit something when the mother threw it into the jungle, as there was a severe bruise on the side of the baby's face.[2]

[848] In another instance, a husband forced his wife to kill a child because he was certain that he did not sire the

[1]Occasionally the woman will arrange to have an abortion when the foetus is in an advanced state of development. The most common practice consists of rupturing the amnion by trauma: a pregnant woman will lie on her back and have someone, usually a female friend or kinswoman, jump on her abdomen. More rarely, she will have her husband rupture the amnion by squeezing her around the abdomen by an arm lock.

[2]The missionary ultimately adopted the infant and brought her to England when he left Venezuela.

847 [848] child: he had scrupulously observed the coitus taboo during lactation--the wife had not.

Most cases of infanticide take place when a couple already has a small child. Sickness takes a heavy toll during the early months of a child's life, and women are reluctant to jeopardize a child that has already survived the first two years. So, they frequently kill the new-born so that their older child will have no competition for milk. Bahimi, a woman of some 30 years, killed a new male baby shortly after I started my fieldwork in Bisassi-tedi. She explained, tearfully, that she did not feel that she could successfully raise the new child because she still had a son that was nursing.

847 562 162 These cases do not, however, explain why there is a consistent bias to kill females rather than males. When I discovered how significantly the sex ratio diverged from the expected value of 1.0 in some villages, I tried to get an explanation from the Yanomamö. I was surprised to find out that they were ignorant of their own bias in killing children. [892] What did come to light, however, was the fact that Yanomamö prefer to have a male baby for their first child and, if it turns out that the first child is a girl, they will frequently kill her. If, however, a couple prefers to have a girl and the first child is a boy, they generally do not kill the boy.[1]

[114] [582] [1]Whatever the reason may be for the preference toward males as eldest children, there is one structural effect that deserves further enquiry. Rose (1960) effectively showed that where males tend to marry females that are younger than them-

When I insisted that she share her food with the child, he ate it ravenously. In short, she was letting the baby die slowly of starvation. I have similar accounts from missionaries who have also witnessed cases such as this.

Male babies are preferred because they will grow up to be warriors and hunters. Most men make known their wishes to have a son—even to the point of insinuating that the wife ought to deliver a male or suffer the consequences. This is always done in a subtle way, usually by displaying signs of anger or resentment at the thought of having a daughter that constantly eats without being potentially an economic asset or guardian of the village. Many women will kill a female baby just to avoid disappointing their husbands. The Yąnomamö also practice abortion in a very crude but effective way. The pregnant woman will lie on her back and have a friend jump on her belly to rupture the amnion. Sometimes abortions are effected because the woman does not want to kill the baby after it is born. In other cases a man will order his wife to abort if he suspects that somebody else conceived the child.

Several techniques are used to kill a newborn child. The most common method is to strangle it with a vine so as not to touch it physically. Another common method is to place a stick across the child's neck and stand on both ends of it until it chokes. In some cases the child is not given the stimulus to breathe and is simply abandoned. Finally, some women throw the child against a tree or on the ground and just abandon it without checking to see if it was killed by the injuries sustained. One of the New Tribes Missionaries discovered a female baby in 1964 that had been discarded in this fashion and brought her home with him. The baby's face was badly bruised on one side, but she survived. The missionary subsequently adopted her legally and is raising her in England.

The demographic result of the Yąnomamö infanticide practices is that there is a shortage of females.[13] This shortage of females, however slight, assumes greater proportions for a number of culturally determined reasons. That is, the shortage of women is even greater than statistics alone imply because of the practice of polygyny and because of taboos relating to sexual intercourse.

The village of Patanowä-teri, for example, has 122 males and only 90 females (see Table 3–3). But many (about 25 percent) of the politically important men in the village have two or more wives. Hence, many men have no wives. Polygyny, therefore, increases the women shortage because the available women are distributed unequally.

In addition to this, the Yąnomamö have taboos against intercourse when a woman is pregnant or is nursing a child. The taboo is by no means followed to the strict letter, since children are nursed for three years or more—some men sheepishly admit having coitus with a lactating wife. Rerebuwä, whose youngest child is about a year old, told me that he recently tried to persuade his wife to make love. He added: "She told me to go take some drugs and chant to my forest spirits; she is still 'stingy' with her vagina." Hence there is considerable concern within the village over the acquisition and possession of

[13]The frequency of female infanticide must be considerably higher than the statistics in Table 3-3 imply, since warfare results in the death of more men than women. This shows up in the age and sex distribution: There are more males in the younger age categories than females because of the infanticide preferences. As the males get older, however, they are more liable to death in warfare, resulting in a fairly even distribution of males and females in the thirty- to forty-year age interval. Finally, there are more old women than old men, also reflecting the higher male mortality due to warfare. I have published more substantial data on Yąnomamö demography in Neel and Chagnon, 1968.
